

# Project Overview

## Valley Lateral Project

The Valley Lateral Project will connect Millennium's gas mainline to CPV's energy center in Wawayanda, NY, and provide access to natural gas for its new 650 MW combined-cycle electric power generating facility.

### 650,000

The approximate number of homes in the region that the CPV Valley Energy Center will be able to supply with the power generated.

### Community Input

Construction and operation of this new lateral will include numerous opportunities for public comment and input and be subject to review and prior approval by the Federal Energy Regulatory Commission (FERC).

### Route Identification

Potential routes are currently being evaluated and a preferred route has not yet been finalized.

The new clean, natural gas generation at CPV Valley Energy Center will improve New York's air quality by reducing dependence on older, less-efficient generation technology.

The CPV Valley Energy Center will help lower power prices for power users in the new capacity zone.
